Prediction Assignment Writeup

This project asks to analyze data by personal activity devices. We first load the data

```
training <-
read.csv(url("https://d396qusza40orc.cloudfront.net/predmachlearn/pml-
training.csv"))
testing <-
read.csv(url("https://d396qusza40orc.cloudfront.net/predmachlearn/pml-
testing.csv"))</pre>
```

Now, we load the necessary packages, set the seed (for it to be reproducible) and a look at the data

```
## 'data.frame': 19622 obs. of 160 variables:

## [list output truncated]
```

Cleaning the data

Now, we commence the cleaning of data, which includes deleting off unrelated and useless columns (containing a lot of NAs). First off is the training dataset.

```
cols_na <- nearZeroVar(training) #cols with little/no variance
training <- training[, -cols_na]

keep_index <- !sapply(training, function(x) any(is.na(x))) #del cols
containing NAs
training <- training[, keep_index]
keep_index <- sapply(colnames(training), function(x)
!grepl("X|time|window",x))
# ^ remove cols with labeling functions
training <- training[, keep_index]
dim(training)
## [1] 19622 54</pre>
```

Now, we do the same filtering to the testing dataset.

```
keep_index <- !sapply(testing, function(x) any(is.na(x)))
testing <- testing[, keep_index]
keep_index <- sapply(colnames(testing), function(x)
!grepl("X|time|window",x))
testing <- testing[, keep_index];
#remove problem_id col
idx1 <- which(colnames(testing)=="problem_id")</pre>
```

```
testing <- testing[,-idx1]
dim(testing)
## [1] 20 53</pre>
```

Machine Learning

Now, we splice the training dataset so we have a 'train' and 'test' data from the training dataset

```
index_train <- createDataPartition(training$classe, p = 0.7, list=FALSE)
training1 <- training[index_train, ]
testing1 <- training[-index_train, ]
Side note:-
control <- trainControl(method = "cv", number = 5)</pre>
```

We set the number of cross validation to 5 instead of the default 10 to save computation time. Also my computer ran out of memory with the default 10.

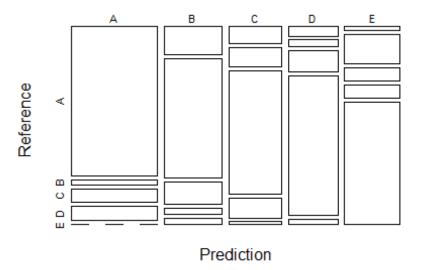

LDA

First, we try Linear Discriminant Analysis (LDA)

```
modFit lda <- train(classe ~., data=training1, method="lda")</pre>
## Loading required package: MASS
print(modFit lda, digits = 4)
## Linear Discriminant Analysis
##
## 13737 samples
      53 predictor
      5 classes: 'A', 'B', 'C', 'D', 'E'
##
##
## No pre-processing
## Resampling: Bootstrapped (25 reps)

## Neg Pred Value
                          0.9976
                                             0.9973
                                                      0.9992
                                                               1.0000
## Prevalence
                          0.2862
                                    0.1925
                                             0.1749
                                                      0.1626
                                                               0.1839
                                    0.1915
## Detection Rate
                          0.2845
                                             0.1726
                                                      0.1619
                                                               0.1839
## Detection Prevalence
                          0.2845
                                    0.1935
                                             0.1743
                                                      0.1638
                                                                0.1839
## Balanced Accuracy
                          0.9970
                                    0.9961
                                             0.9927
                                                      0.9968
                                                               1.0000
(accuracy_rf <- conf_rf$overall[1])</pre>
## Accuracy
## 0.9943925
plot(modFit_rf)
```

So, from the three models (LDA, Classification Tree, Random Forest) The accuracies are as follow

LDA: 72.6%

Classification Tree: 55%

Random Forest: 99%

As you can see, random forest so far has the best accuracy. The prediction of classe on testing dataset as follow

```
(predict(modFit_rf, testing))
## [1] B A B A A E D B A A B C B A E E A B B B
## Levels: A B C D E
```
